

Facials & Skin Treatments with Electrical Modalities

by Margot Pehk,
Master Aesthetician and Skin Therapist

Each year, millions and millions of cosmetic procedures, both invasive and non-invasive, are performed according to the American Society of Plastic Surgeons (ASPS). Of those procedures, eyelid surgery ranked #4 for surgical procedures, and Botox was #1 for minimally-invasive procedures. It is no mystery that people are concerned with their looks, the aging and how to prevent or slow down the aging process.

So what can a professional skin therapist offer to a client who is concerned, but is not a candidate for eye or face surgery or is hesitant to get injections?

The answer is easy – electrical modalities.

Electrical modalities, best offered in a series, may be combined with key ingredients for results-oriented treatments. They're great because they can be used over the whole face, or they can target the eye area and treat signs of aging while being minimally invasive.

Ultrasound: A versatile modality that can be used for deeper penetration of actives, masques and stem cell serums, hyaluronic serum fillers. Sound waves produce a warming of the tissue and micro vibrations on the surface of the skin, causing tiny gas bubbles known as “cavitation.” These gaps between epidermal cells, combined with tissue warming, allow for ingredients to penetrate. This is excellent to use around the eye area with Image Vital C Hydrating Masque or Image MD restoring Collagen Serum to minimize fine lines, wrinkles, dark circles, puffiness and signs of dehydration. Treatment is extremely beneficial for redness prone skin or Rosacea skin.

Iontophoresis & Galvanic current: Iontophoresis with galvanic current and specific iontophoresis with microcurrent allow water-soluble products to permeate into the skin via electrical current. Both methods produce a calming and vasoconstrictive effect on the skin, while driving active ingredients deeper into the skin.

Microcurrent: What Is Microcurrent?

Microcurrent is a safe and effective non-invasive technology used in age management facials that utilizes a low level of electricity to stimulate the face. Microcurrent is the most cutting edge efficacious anti-aging technology

available. Microcurrent facials result in skin that is firm, contoured, and hydrated. Applications can be enjoyed as a one time facial, or in a series for improved comprehensive results.

How Does Microcurrent Work?

Microcurrent is an extremely low level of electricity that mirrors the body's own natural electrical current. Because this low level of electricity is subsensory, treatments are comfortable and painless. Together with proven application techniques, microcurrent technology offers clients a natural solution to the age management fight. Treatments are comfortable and painless.

A series of treatments can be used in place of Botox injections, or muscle re-education can be used to prolong and enhance the effects of injections.

From the biochemical side, studies show that microcurrent stimulates the production of Adenosine Triphosphate (Cheng, et al. 1982). ATP is the powerhouse that provides energy for key functions, including protein synthesis which aides in collagen and elastin production.

Re-education of muscles results in firmer muscle tone, improved elasticity, smoother skin texture

Optimizes skin health by repairing cellular damage

Stimulates production of collagen, elastin and ATP energy

Improves circulation and increases moisture retention

Promotes healthy function of the skin

Delivers essential nutrients deep into the skin
